Assignment 7 - Designing The Game

Loic Konan

Description

To use **Object Oriented Programming** mindset to clarify what we need to implement, what classes are needed, how those classes are related and finally to specifies how they will carry out their resposibilities.

Files

#	File	Description

1	Diagram.png	Visual model of the classes using UML	

Instructions

- 1. Identify the classes and objects to be used in the program.
- 2. Define the attributes for each class.
- 3. Define the behaviors for each class.
- 4. Define the relationship between classes.

Possible Classes

Player

- Has a Shape
- Has a Size
- Has a Color
- Has a Speed
- Has a Location (could change)
- Can move in any direction using keys
- Can collide with other "objects"

Player

-collision: bool

-movement: int

-shape: string

-color: int

-size: int

-speed

-location

+speed()

+collide()

Debris

- Has a Shape
- Has a Size
- Has a Color
- Has a Speed
- Has a Location (could change)
- Can move in any direction
- Can collide with other "objects"

Debris

-collision: bool

-movement: int

-shape: string

-color: int

-size: int

-speed

-location

+speed()

+collide()

Scoring

- When a Player comes collides with Debris score is negatively effected.
- When a piece of Debris leaves game screen (on the left), score is positively effected.

Scoring	
-collision: bool	
-scoring())

Text

- Has a Font (can change)
- Has a Location
- Has a Color
- Has a Size

	Text	
-font: int		
-color: int		
-size		

Game

- Has player(s)
- Has score(s)
- Has debris(s) (yes "debris" can be plural but it doesn't make the point)

Game	
-screen: int	
+player()	
+text()	
+debris()	
+scoring()	

Shape

- Is a player
- Is a debris

Shape	
-player: string	
-debris: string	
+shape()
